Client Consultation

At FBT Gibbons, we help clients navigate the evolving landscape of generative AI with practical, real-world applications. In one recent engagement, we supported a client in the advanced manufacturing space as they pursued arbitration over a high-stakes contract dispute. Before deploying a Generative AI (GenAI) tool, we worked closely with the client's legal and privacy teams to ensure the tool met their rigorous standards for data protection and confidentiality. Our team then leveraged the tool to streamline deposition prep, summarize key documents, and accelerate legal research—enabling deeper focus on strategy and expert collaboration. The client's legal team later requested a demo to explore broader use cases.

We're also seeing strong interest in GenAI from clients eager to understand how law firms are using it in practice. At a recent CLE program exclusively designed for one client's legal team, we included a session on integrating AI into legal workflows—highlighting both the promise and the practicalities. The discussion sparked thoughtful questions and opened the door to deeper conversations about how GenAI can enhance legal work.

We are committed to identifying opportunities for GenAI to enhance value for our clients and look forward to collaborating with them to explore how we can streamline time-consuming tasks for mutual benefit. FBT Gibbons seeks to partner with clients to better understand and test the ideal use cases for generative AI and other technologies—ensuring that innovation is aligned with their goals, workflows, and standards.
